

**^^/1****Description**

```
^^Predicate
```

Calls a redefined/inherited definition for a message. Normally only used in the body of a predicate definition for the message. Predicate should match a public or protected predicate of self or be within the scope of this.

**Template and modes**

```
^^+message
```

**Errors**

Predicate is a variable:

```
instantiate_error
```

Predicate is declared private:

```
permission_error(access, private_predicate, Predicate)
```

Predicate is not declared:

```
existence_error(predicate_declaration, Predicate)
```

Container of the inherited predicate definition is the same object that contains the ^^/1 call:

```
endless_loop(Predicate)
```

**Examples**

```
init :-  
    assertz(counter(0)),  
    ^^init.
```
